TsunaGo 繋

JAPAN × INDIA BUSINESS CONNECTIONS

Verified India market entry for Japanese SMEs

From “which state?” to “send the first email” — with evidence at every step.

繋 — 日本とインドを、確かな一歩で。

6 / 6 parts of JETRO-PS-01 covered by a working stage	**37** compliance rules, each with a source and a verification level	**11** cited market sources; missing data shown as “Unknown”	**862** Japanese UI strings — the whole app switches to 日本語

At a glance

- **One plan, six stages** mapped to the problem statement: Market → Partners → Localize & price → Compliance → Culture → Pilot, with a progress checklist and saved “ventures” for what-if copies.
- **Partner Scout, an AI agent**, plans searches, reads Indian companies’ own websites, verifies every quote and contact against the page, reflects and searches again, then drafts a bilingual email the SME sends from its own Gmail.
- **AI reads and writes; rules decide.** Partner checks, scores, region ranking, the compliance schedule and all costs are deterministic code — explainable and instant.
- **Evidence everywhere:** dated sources, “Unknown” instead of guesses, and evidence tags F fact U input E estimate H hypothesis.
- **Free to run** on open models (gpt-oss-120b on Groq) with automatic fallback; keys never reach the browser.

1 Problem and approach

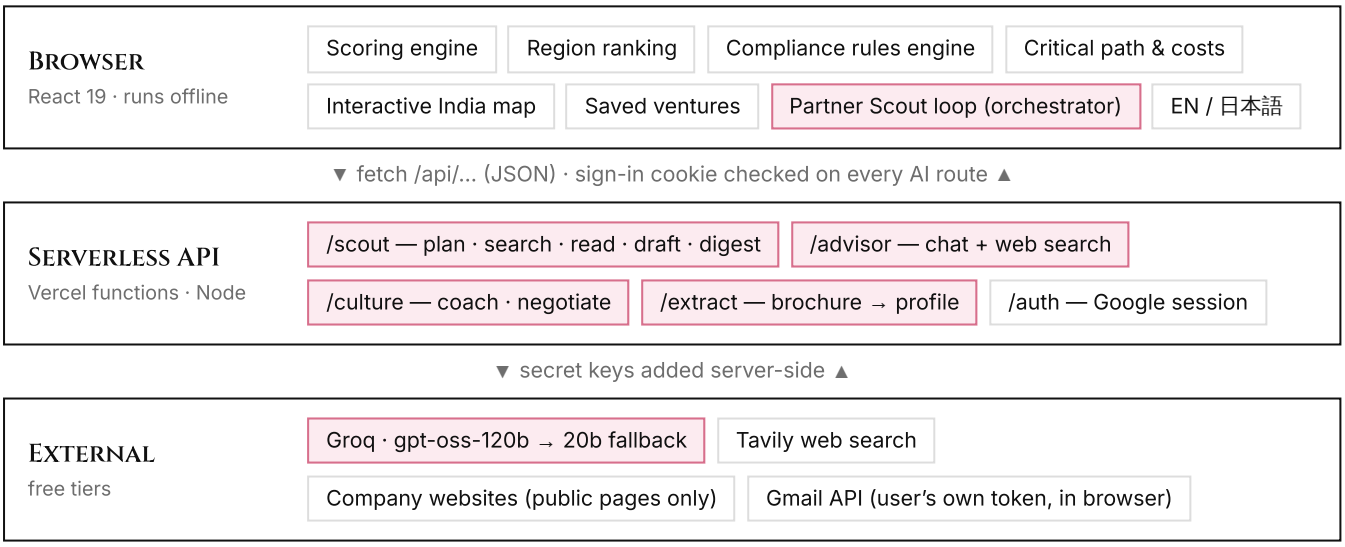

A Japanese SME with a competitive product still has to answer, alone and in a foreign market: *which state*, *which partner*, *what price*, *which filings* and *how to talk to Indian counterparts*. Today that means a market report, a partner directory, a consultant, a lawyer and a culture trainer — weeks of work and high cost before the first pilot.

TsunaGo turns the six parts of JETRO-PS-01 into one guided plan. Every screen is driven by the SME's own answers, and every claim carries its evidence, so an SME — or a JETRO adviser — can see what is verified and what still needs checking.

START	PS PART 1	PS PART 2	PS PART 3	PS PART 4	PS PART 5	PS PART 6
Profile	**Market**	**Partners**	**Localize**	**Compliance**	**Culture**	**Pilot**
preset SME + six questions	sector, buyers, 3-state comparison	checks, scores, AI scout	AI advisor: price, model	roadmap, critical path	playbook, coach, negotiation	milestones, open checks

2 System architecture

A React single-page app does the work in the browser; serverless functions exist only to keep API keys secret. **Pink = uses a language model**; everything else is deterministic.

Design rule: AI reads and writes; rules decide

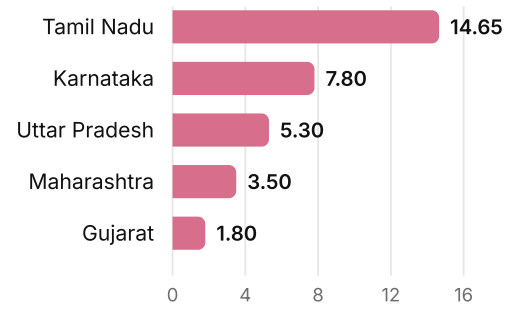

DETERMINISTIC CODE	LANGUAGE MODEL	HOW THE AI IS KEPT HONEST
Essential checks, weighted scores, region ranking, compliance schedule, costs, duty calculator, market ratings	Reading websites and brochures, planning searches, writing emails, advising, coaching messages	Strict JSON schemas · verbatim quote per fact, searched in the source · contacts must appear on the company's own page · evidence tags · "Unknown" instead of guesses

3 Market evidence, state by state

For each of five industries the Market stage shows sector size, demand signals, barriers, the target buyer and a three-state comparison. Every rating links to its source and date; product-specific demand is **always "Unknown"** until the SME speaks to buyers.

Electronics exports by state

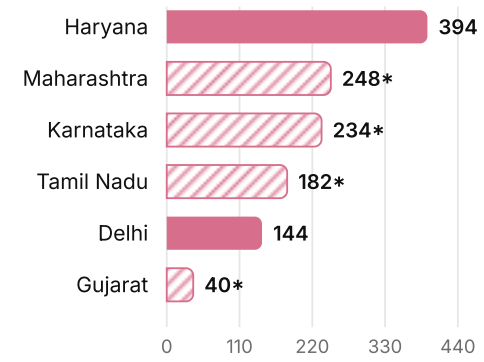

FY2024-25 · USD billion

Source: state electronics export data FY25 (via Civilsdaily / Digital Terminal); Business Standard on Niryat data.

Japanese companies by state

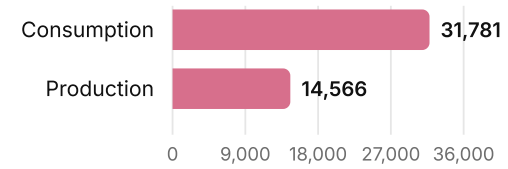

Embassy of Japan & JETRO list · Oct 2024

*Hatched * = transcribed from secondary reporting, still to be checked against the source PDF.*

Machine tools: India buys more than it makes

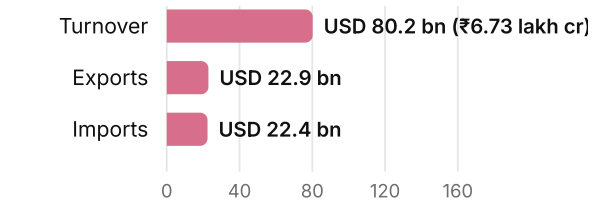

FY2024-25 · ₹ crore

Source: IMTMA figures (via market reports). The gap is met by imports — an opening for Japanese machinery.

Auto components

FY2024-25 · ACMA

+9.6% year on year; 14% CAGR FY20–25. Tamil Nadu ≈35% of component output.

How a state is rated

FACTOR	EVIDENCE USED	RULE
Relevant buyer base	ACMA, state agencies, NITI Aayog, Annual Survey of Industries	Strong / Moderate / Limited from the cited share; Unknown if no figure (10 Strong · 4 Moderate · 1 Unknown across 15 state-sector cells)
Japanese ecosystem	Embassy of Japan / JETRO company list	≥200 companies Strong · ≥100 Moderate · else Limited
Demand for your product	— (no dataset measures it)	Always **Unknown**: validate with 5–10 buyer conversations
Service practicality	Service model from the SME's answers	"To check" if a local partner must install; else "Not required"

4 Partner Scout — an agent that proves what it finds

The agent runs in the browser as an orchestrator over short server tools, so no single call exceeds the 60-second serverless limit and every step appears live.

1 · PLAN	2 · SEARCH	3 · READ	4 · VERIFY	5 · SCORE	6 · DRAFT
Goal → queries requirements + 2–3 searches	**Tavily** ~30 directory & marketplace domains skipped	**Company sites** home + contact page, 2 at a time	**Quotes & contacts** must appear on the page	**Engine** essential checks + weights	**EN / JA email** sent only after confirm

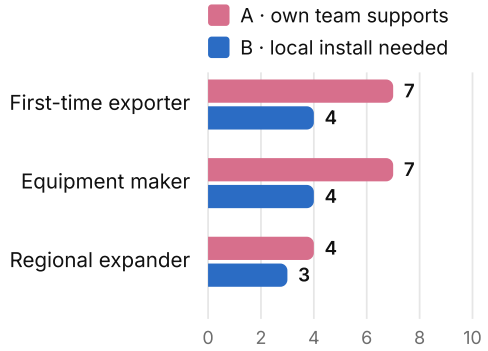

↺ Reflect: if fewer than 2 partners pass, the planner is told why they failed and which sites were read, then searches again

Verification layers

Schema	The model must return typed JSON (enums for type, state, industry)
Quotes	Every fact carries a verbatim quote; normalised and searched in the page text. Not found → "pending"
Contacts	Email / phone verified only if present on the company's own page
Policy	No directories, no personal data, nothing sent without the SME's confirm
Safety	Public hosts only; redirects re-checked; 10 s timeout; 400 KB cap

Service model changes who qualifies

Partners passing all essential checks · 10 demo partners

Computed by the scoring engine on the illustrative demo dataset. In model B the install check (≥5 engineers) excludes sales-only firms.

How a partner is scored

STEP	RULE (DETERMINISTIC)
Essential checks	Customer access ≥ 55/100 · installs with ≥ 5 engineers (model B) · minimum commitment ≤ budget · no competing brand. Any fail = excluded, with the reason shown.
Sub-scores	reach, technical, cost, speed, Japan experience — each 0–100 from the partner profile
Weights	The SME's own priority dots (1–5); technical × 1.6 in model B
Open checks	Every unverified fact becomes a to-do in the pilot plan

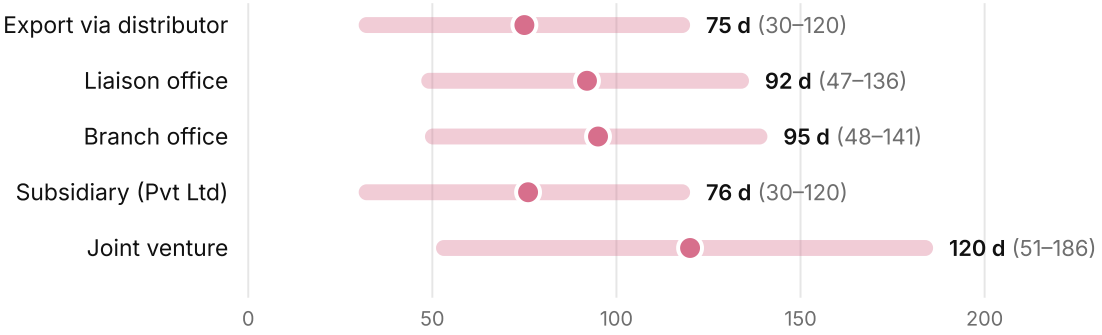

Equipment-manufacturer profile, model B: exclusion reasons — fits your entry budget (2) · can install & service locally (4) · no competing principal (1).

5 Compliance roadmap — who files what, in what order

A wizard (entry mode, product category, ownership, data, state, staff) selects from **37 rules**. Each step has an authority, documents, days, fee ranges, an owner, the risk if missed, a source and a verification level. The engine schedules steps on their dependencies and finds the critical path.

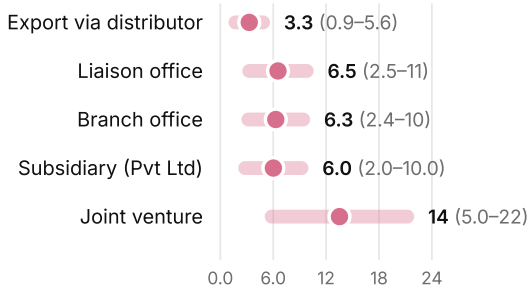

Time to operate by entry mode

Sample: Japanese packaging-machinery maker, Gujarat · days · dot = likely, bar = min–max

One-time set-up cost

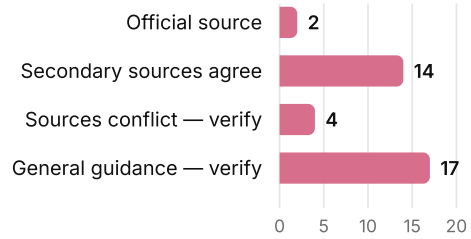

₹ lakh · government + indicative professional fees

Ranges, never single numbers; replace with 2–3 real quotes.

How well each rule is verified

37 rules · checked 2026-10-24

Shown on every step in the app. "Conflict" = recent 2026 changes (land-border FDI, BIS machinery order, tax forms).

ENTRY MODE	STEPS	LIKELY DAYS	ONE-TIME ₹L	YEARLY ₹L	CRITICAL PATH
Export via distributor	7	75	3.3	0.0	`bis-otr`
Liaison office	15	92	6.5	0.4	`parent-docs → rbi-office → roc-fc1`
Branch office	17	95	6.3	3.0	`parent-docs → rbi-office → roc-fc1 → bo-tax`
Subsidiary (Pvt Ltd)	22	76	6.0	4.3	`parent-docs → dsc → incorp → capital → allot → fcgpr`
Joint venture	23	120	14	4.3	`fdi-route → jv-sha → incorp → capital → allot → fcgpr`

6 Localize & price — the AI advisor

The team's senior market-entry advisor prompt runs verbatim with the SME's profile injected. It works through go / no-go, localization, the price waterfall from Japanese price to Indian landed price, entry model and validation plan — with **live web search** for duties and rules that change, citing dated sources. Every claim is tagged F U E H. It never names Indian companies — that is Partner Scout's job, where claims are verified.

7 Culture & negotiation

Playbook: 10 Japan-vs-India business norms (decisions, “yes” and 「検討します」, price talks, timelines, WhatsApp, hierarchy, contracts, payment, calendar) — each ending in a concrete action.

Message coach (AI): rewrites the SME’s email for an Indian counterpart, returns a Japanese back-translation and flags how the original could be misread.

Negotiation prep (AI): likely asks, give-and-get concession ladder, red lines and bilingual phrases for a shortlisted partner.

EXAMPLE THE COACH CATCHES

「独占販売の件、社内で前向きに検討させていただきます。」

“We will consider it positively” — in Japan often a polite no; an Indian distributor may read it as **yes**.

> *“…We are reviewing it and will give you a clear answer by 15 November.”*

8 Pilot & long-term operations

The pilot plan turns the chosen region, partner and open checks into a timeline with owners. Saved **ventures** keep each India plan (and what-if copies) separately; ventures export as files to share with a team or adviser.

9 Feasibility and impact

CONSIDERATION	APPROACH
Cost to run	Free open models and search tiers; static front end on a CDN; stateless functions. Marginal cost per SME near zero — JETRO could offer it to thousands.
Reliability	Automatic model fallback (Groq retired Llama 3.3 in Aug 2026 — handled); provider switch by one variable; recorded runs replay offline.
Numeric trust	Scores, schedules, costs and duties are computed by code, never generated by the model.
Security & privacy	Keys server-side; Google sign-in with verified signatures; HttpOnly cookies; SSRF-safe fetching; sanitised rendering; plan data stays in the user’s browser.
Positioning	Complements JETRO advisers: SMEs arrive with a verified, structured plan, so adviser time goes on judgement, not first-pass research.

Honest limitations

- Built-in partner list is illustrative; real partners come from Scout or brochures.
- 21 of 37 rules still need primary-source checks (labelled in-app).
- No accuracy benchmark yet for extraction — planned (below).
- Plans are stored per browser; export/import bridges devices.

Roadmap

- **Next:** measure extraction accuracy on 50 hand-labelled company pages; verify remaining rules with a CA.
- **Then:** live GST / MCA registry checks; cloud-synced ventures; JETRO adviser view.
- **Scale:** more sectors and states with sourced data; post-entry deadline alerts.
